PROFESSIONAL SUMMARY

Senior Software Engineer with 7+ years of experience designing, building, and operating backend systems, distributed architectures, and cloud-native platforms for startups and growth-stage technology companies. Proven track record owning API design and lifecycle management, optimizing relational and NoSQL data stores, and driving infrastructure automation across containerized, multi-service environments. Skilled at leading reliability initiatives — caching strategy, query optimization, zero-downtime deployment, and observability — that materially improve system performance and uptime. Experienced technical leader who mentors engineers, sets engineering standards, and partners cross-functionally to ship scalable, maintainable software. Active open-source contributor building platform tools used by educational institutions and developer communities.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Java, Python, PHP, Rust

Frontend: React.js, Next.js, Vue.js, Tailwind CSS, Shadcn/UI

Backend: Node.js, Express.js, NestJS, Spring Boot, Laravel, Django, Flask, FastAPI, Axum

Databases: PostgreSQL, MySQL, MongoDB, Firebase, Redis

Cloud & DevOps: AWS, Azure, Google Cloud, Docker, GitHub Actions, CI/CD

Other: REST APIs, System Design, Distributed Systems, Linux, Infrastructure Automation, Caching, Performance Optimization

WORK EXPERIENCE

AnalogueShifts

Remote

Senior Software Engineer

2024 – Present

- Architect and maintain internal developer platform tooling, consolidating fragmented workflows into a unified service layer that reduced manual operational overhead across engineering teams.
- Design and orchestrate background job pipelines for asynchronous processing, improving throughput and isolating failure domains from user-facing request paths.
- Build monitoring and alerting systems providing real-time visibility into service health, application errors, and infrastructure resource usage, shortening incident detection and response time.
- Implement zero-downtime deployment pipelines using rolling and blue-green strategies, eliminating service interruptions during releases.
- Plan and execute database schema migrations on production systems with backward-compatible rollout strategies, ensuring data integrity with no downtime.
- Lead architecture decisions for scalable backend services, establishing patterns for service boundaries, data ownership, and inter-service communication.
- Champion reliability engineering practices — structured logging, health checks, and graceful degradation — to harden core systems against partial failures.
- Improve developer productivity by standardizing local development environments, CI feedback loops, and internal documentation across the engineering org.

Vroom NG

Remote

Senior Backend Engineer

Oct 2023 – Mar 2025

- Owned backend architecture for core ride-hailing platform services, making key decisions on service boundaries, data modeling, and API contracts.
- Designed and operated high-availability backend services supporting real-time location and dispatch workloads, prioritizing fault tolerance and graceful degradation.
- Introduced Redis-based caching strategies for frequently accessed data, reducing database load and cutting average response times on high-traffic endpoints.
- Led query optimization and database indexing initiatives on PostgreSQL/MySQL data stores, eliminating slow queries and improving overall application responsiveness.
- Drove API performance improvements across core services through profiling, payload optimization, and connection pooling, increasing throughput under peak load.

- Spearheaded scalability initiatives to prepare backend infrastructure for growing user and trip volume, including horizontal scaling of stateless services.
- Improved platform reliability by introducing structured error handling, retry logic, and circuit-breaker patterns across critical service integrations.

AnalogueShifts

Full Stack Developer

Remote

Apr 2022 – Jun 2024

- Owned the full lifecycle of internal and customer-facing APIs — design, implementation, versioning, and deprecation — across multiple product surfaces.
- Implemented CI/CD pipelines using GitHub Actions to automate testing, build, and deployment, reducing manual release effort and shortening lead time to production.
- Contributed to distributed systems components supporting service-to-service communication and asynchronous task processing.
- Participated in system architecture discussions, helping define data flow and service boundaries for new product features.
- Collaborated cross-functionally with product, design, and QA to translate requirements into technical specifications and shippable features.
- Mentored junior engineers on backend best practices, code review standards, and debugging techniques, accelerating their ramp-up time.
- Authored technical documentation and READMEs to improve codebase maintainability and onboarding for new team members.

FEATURED OPEN-SOURCE PROJECTS

Penlumen — Open-Source Education Platform

github.com/Tesimune/penlumen

- Architected a modular, open-source educational technology ecosystem providing schools and learning institutions with a School Management System, Learning Management System (LMS), collaborative document editing, and virtual laboratory environments.
- Designed the platform's modular architecture to allow institutions to adopt individual components independently, enabling extensibility across diverse educational infrastructure needs.

Places — Open-Source Location Cache System

github.com/Tesimune/places

- Built a location-caching platform that indexes and serves geospatial query results to reduce reliance on paid third-party location APIs, cutting per-request Google Places API costs.
- Implemented geospatial search and indexing for high-performance location retrieval, optimizing for low-latency reads under repeated query patterns.
- Designed a scalable caching architecture that intercepts redundant API calls, directly reducing external API request volume and associated operating costs.

Poste.io Self-Hosted Mail Infrastructure

github.com/Tesimune/poste.io

- Deployed a containerized, self-hosted mail server using Docker Compose and Poste.io, provisioning SMTP, IMAP, and webmail services from a single infrastructure stack.
- Automated SSL certificate management and infrastructure provisioning, demonstrating hands-on infrastructure engineering and self-hosted systems administration.

EDUCATION

Miva Open University

B.Sc., Cybersecurity

Nigeria

Mar 2025 – Dec 2027

Kaduna State University

B.Sc., Chemistry

Nigeria

Jan 2018 – Jan 2024

CORE COMPETENCIES

System Design • Distributed Systems • Backend Architecture • Platform Engineering • API Design • Database Optimization • DevOps • Cloud Infrastructure • Technical Leadership • Mentorship • Reliability Engineering • Performance Optimization
